Why is this so awesome?

- 🚀 **Integration with other Nextcloud apps!** Currently Contacts, Calendar & Files – more to come.
- 📥 **Multiple mail accounts!** Personal and company account? No problem, and a nice unified inbox.
- 🔒 **Send & receive encrypted emails!** Using the great Mailvelope browser extension.
- 🙈 **We're not reinventing the wheel!** Based on the great Horde libraries.

And in the works for the coming versions:

- 📚 Proper grouping of message threads
- ⚡ Caching to make everything faster
- 📎 Even better attachment support
- 📦 Folder management & moving mails

Installation

In your Nextcloud, simply navigate to »Apps«, choose the category »Productivity«, find the Mail app and enable it. Then open the Mail app from the app menu. Put in your email account credentials and off you go!

If you experience any issues or have enhancement suggestions you can report them in our issue tracker. Please follow the issue template so we get the info we need to be able to debug and fix the problem. Thanks!

Maintainers

Christoph Wurst, Thomas Müller, Jan-Christoph Borchardt, Steffen Lindner and many more

If you'd like to join, just go through the issue list and fix some. :) We're also in #nextcloud-mail on freenode IRC.

Developer setup info

Just clone this repo into your apps directory (Nextcloud server installation needed). Additionally, nodejs and npm are needed for installing JavaScript dependencies.

Once node and npm are installed, PHP and JavaScript dependencies can be installed by running

```
make install-composer-deps
make optimize-js
```

Be fun! :)
